

HVI-TEC hands free telephones - custom-made

Conversion of an existing intercom system to a hands-free telephone or migration from analog telephony to VoIP.

Have you ever thought about converting an existing intercom system to a hands free telephone?

There is an intercom somewhere in the office that is hardly ever used in off-peak times. The customer or courier in front of the door will try to find a telephone number in an emergency and learn from the automatic announcement that he will call outside of business hours and nobody will open the door.

With the HVI-TEC Multi-a/b telephone electronics, 2 to 8 central units or trunk lines can be connected to the hands free telephone, which enables direct access to the individual tenant telephone systems.

Door calls can now be processed and routed individually according to customer requirements in order to establish a voice connection to any telephone and use it to open the door, regardless of whether it is a desk, DECT, SIP or mobile phone.

If the migration from analog telephony to VoIP also affects existing hands-free telephones from other manufacturers that are no longer available, we are able to produce VoIP telephones based on samples or dimensional drawings that fit into the existing opening, thus making costly structural adjustments unnecessary do.

Make use of our experience in the development and manufacture of special telephony devices.

When replacing existing analog telephones, the use of a VoIP telephone with PoE supply can prevent costly structural modifications and electrical installations from being necessary.

The telephones of the HVI-TEC Series 2000 can also be equipped with an IP HD color camera on a single network connection. The camera is part of the hands-free system and is connected to the second LAN connection (port 2) on the telephone circuit board using the built-in video encoder circuit board. This means that only 1 IP connection is required, which in most cases should be able to be led through the existing pipe system to the hands free telephone.

Custom specifications:

If our selection of hands free telephones does not cover any of your special requirements, we will be happy to develop telephones according to customer requirements.

If you are planning a project, please do not hesitate to ask us for advice.
